AI LAB · TAKE THIS WITH YOU

A decision-maker's first page on AI

For decision-makers who want AI in sales and operations without being carried away by the hype.

Take busywork off the list, not people.

Choosing, reviewing and deciding are human work. Let AI start with chores such as organizing, drafting, comparing and tracking. Pick the one chore that causes the most friction.

The decision-maker should use it first.

Try it yourself, then share it with the team, and only later consider letting an agent act on its own. You need to use it to know what you can let go.

Make human review a rule.

Grant only the access a task needs; prefer read-only over writing. A decision-maker reviews spending, external messages and changes to core records. Set a budget cap and a limit on back-and-forth for every task.

Ask first: can you undo a mistake?

Drafts and code can return to an earlier version; sent email, shipments and payments cannot. For anything hard to undo, the decision-maker makes the final call, however many agents are involved.

A practical first week.

Pick one chore and start small. For example, prepare ten to fifteen outreach emails for the decision-maker to review. Adjust industry language, then expand only when the work looks right.

Three common misconceptions

"Agents are mature enough to limit themselves." They are not; you set the boundaries.

"Add a coordinator agent and you no longer need limits." It adds another check, and it can cost money and make mistakes too.

"More agents are always better." Set roles before adding people. Without a cap, the cost is decided for you, not by you.

TRY IT YOURSELF

Giving an agent access: Chapter 13 | **How many agents?**

Illustration / fictional scenario; not a description of any company's practice.
